## Introduction about project

Our team has been assigned a project work to make a website on the Fitness Club. In this project we have done lot of the things and learned a lot in this the main objective behind the giving this project is to understand the concepts of html, CSS , Javascript and many other resources which helped us to make this project. By the help of the html we have learned how to display text, images and other forms of multimedia on a webpage. We have added lot of images which makes our website attractive. We have also learned the concepts of the CSS which stand for "Cascading Style Sheet".

This concept helped us to format the layout of the webpage. They can be used to define text styles, table sizes, and other aspects of Web pages that previously could only be defined in a page's HTML. ... Plus, CSS makes it easy to change styles across several pages at once. We also learned about the JavaScript.

JavaScript is a scripting language which is used for making your website dynamic. Writing Javascript code together with CSS and HTML can make your website more interactive and responsive. Instead of showing static content which will make your users to hit the close button, you can now hold your users' interest to your website.

Apart from these things we have also learned how important is fitness for a person and even the nutrition required to maintain the fitness that one has gained or still gaining. One can even practise his fitness programme through the online resources and websites. We have made one of them by taking the reference of the popular sites.

In our project we have designed 4 webpages on total, namely:

1. Home page / Landing page.
2. Login/ Sign up page.
3. Events page.
4. About us.

## Homepage

Our Home page is developed by Ashiq Al Arefin.

This page consists of info regarding the services provided by us and a little description related to them and also a navigation bar which can be used to navigate to the other related pages of the club as mentioned above. You can even register for the club using the Register Now button present on the page it self

We have used "html and CSS" to design this home page.

## Events Page

Our Event page is developed by Bhaskara Anurag Karumuri. It consits of the fitnesevents listed that are being held in and out of Mumbai like 10K run an Indian virtual Marathon, etc. You can even register for the events which you are intrested in by paying a certain amount of fee described by the event management as registration fees through secure payment portals. You can find the social media handles and help support at the bottom of the site. You can view the event details by clicking on the desired one.

We have used "html, Javascript and CSS" to design this page.

## **Login/Sign up Page**

Our Login/Signup page is developed by Md.Obaydul Islam Apon. This page consists of two parts namely: Sign In and Sign Up basically Sign In is used by the end-users who have already created an account in our website. And Sign Up part is used by the end-users who are creating an account for the first time. The Sign Up process is so simple that you need to enter a very few personal details of yours and contact number and a personal mail-ID and set the username of your choice and also a password that you could remember. And that's it your account will be created. For Sign In you need to enter the username and password which you set while creating the account and click on "SIGN IN" then you will be redirected to your account!

We have used "html, CSS, and Javascript" in creating this webpage.

## **About Us Page**

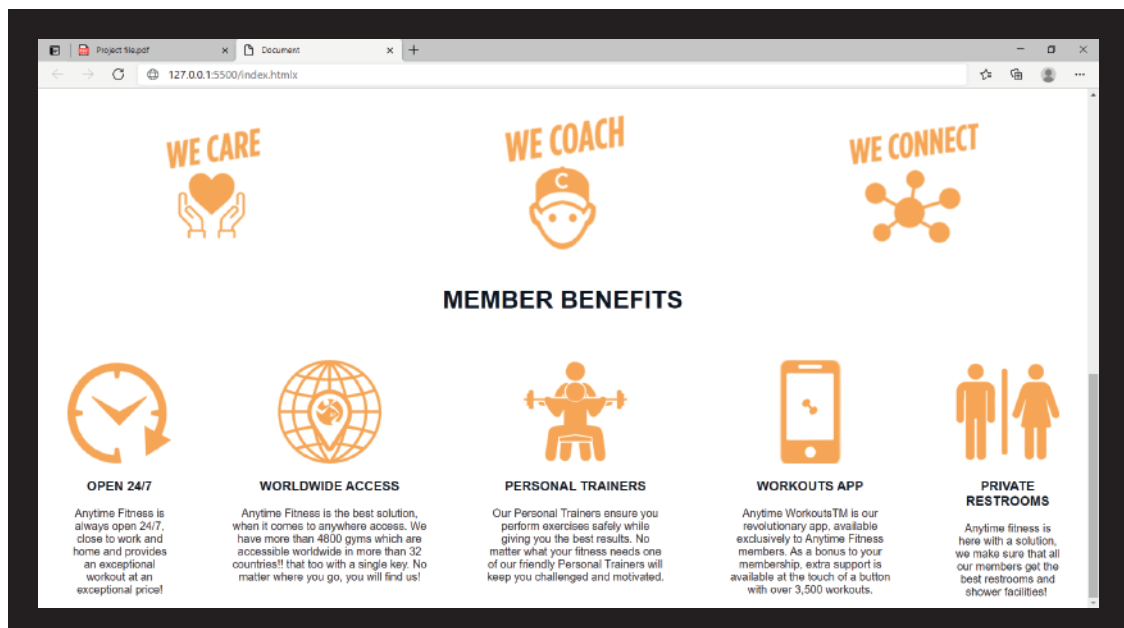

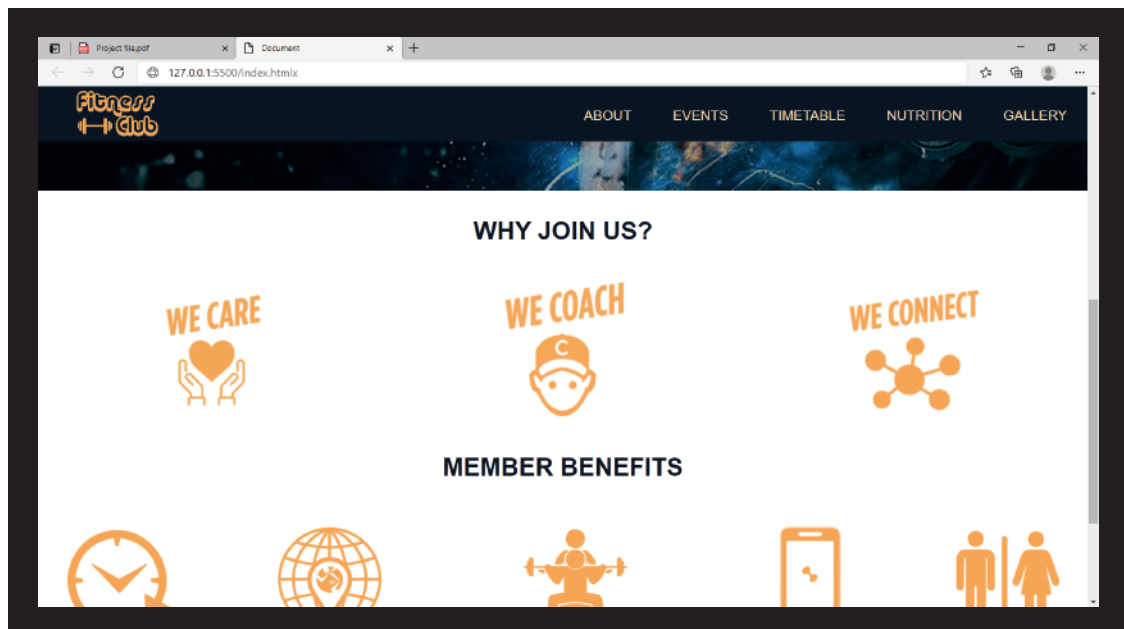

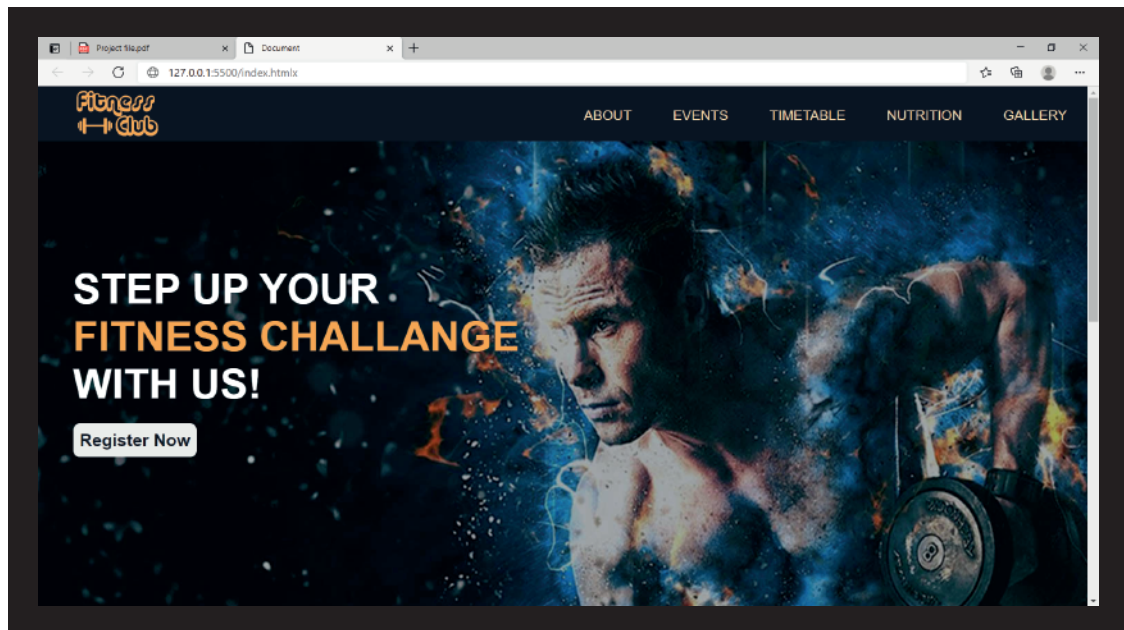

Our About Us page is developed by Ashiq Al Arefin.

Then there comes the last and final webpage of our project - About us page.

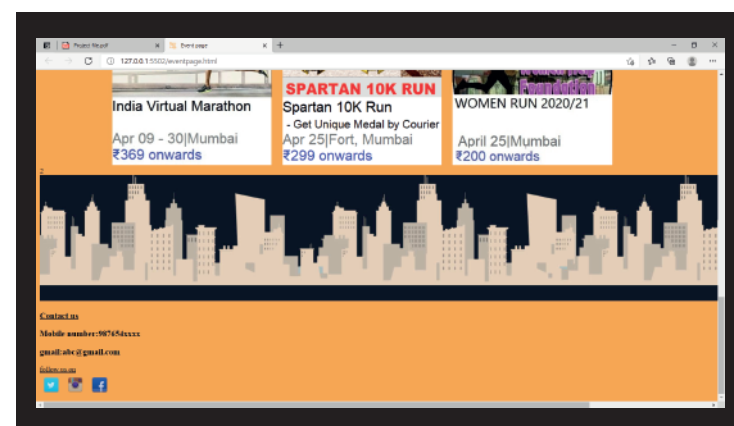

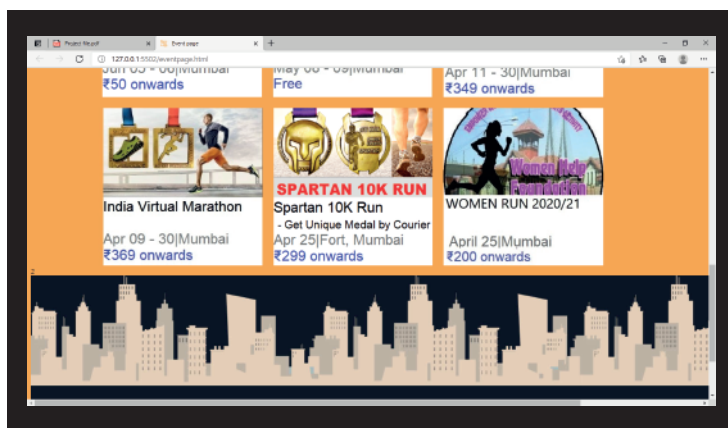

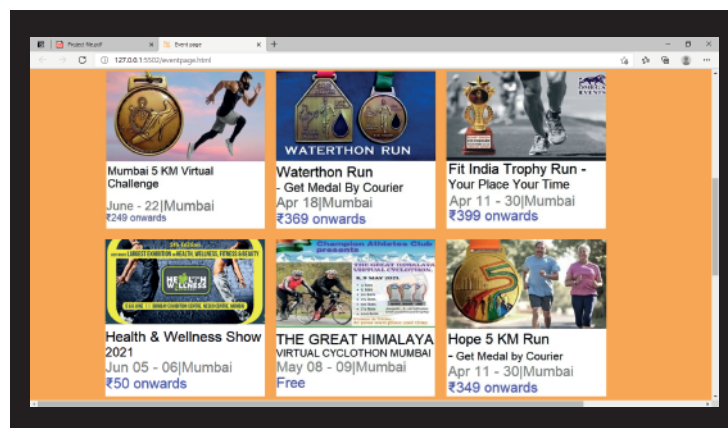

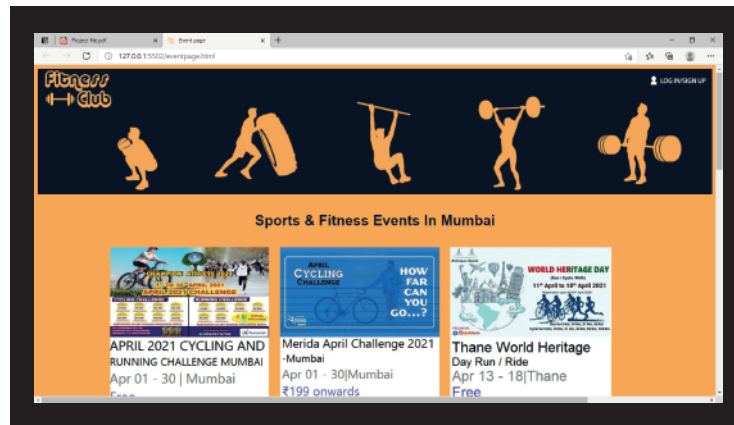

In this page we have just described ourselves in short manner and our contact details in short.

We have used "html, CSS" in designing the webpage.
